

1    **ABSTRACT OF THE DISCLOSURE**

2        A shockproof microphone support device has a retaining base for retaining  
3    on a support rod, a supporting base secured on the retaining base, and a holder  
4    assembled on the supporting base by a shockproof strip for receiving a  
5    microphone. When the support rod receives a vibration or shock, the vibration  
6    passes through the retaining base and the supporting base to the shockproof  
7    strip, and then is absorbed by the shockproof strip, whereby potential  
8    undesirable noises generating from the microphone are effectively avoided.
